

Attorney's Docket No. K&A 23-0730  
Client's Docket No. 13824

**APPLICATION**

**FOR UNITED STATES LETTERS PATENT**

----

**SPECIFICATION**

TO ALL WHOM IT MAY CONCERN:

BE IT KNOWN THAT I, **RICKY MANIER**, a citizen of  
UNITED STATES OF AMERICA, have invented a new and useful  
**TELEPHONE MESSAGE EXPORTING SYSTEM** of which the  
following is a specification:

# TELEPHONE MESSAGE EXPORTING SYSTEM

## CROSS REFERENCE TO RELATED APPLICATION

5

This application claims the benefit of U.S. Provisional Application No. 60/447,814, filed February 14, 2003.

## BACKGROUND OF THE INVENTION

10

### Field of the Invention

The present invention relates to telephone answering machines and more particularly pertains to a new telephone message  
15 exporting system for permitting exporting of collected messages to printed form or electronic form for later review by a user.

### Description of the Prior Art

20

The use of telephone answering machines is known in the prior art. U.S. Patent No. 5,661,783 issued to Assis on August 26, 1997 describes a connection of several separate devices including a computer to digitize and display or print messages. Another type of communications machine is U.S. Patent No. 6,342,901 issued to  
25 Adler et al. on January 29, 2002 describes a networked parasitic user interface terminal to display information obtained through a communications link with a remote processor. U.S. Patent No. 6,310,940 issued to Ratz on October 30, 2001 discloses another networked phone system hard-wiring multiple telephones to a  
30 computer.

While these devices fulfill their respective, particular objectives and requirements, the need remains for a single device that works in a self-contained manner to produce written messages translated from incoming telephonic messages as desired by a user.

5

## **SUMMARY OF THE INVENTION**

The present invention generally comprises an answering machine having multiple phone and answering machine features coordinated by a central processing unit. Programming converts digital messages into a printable form. A printer is provided to permit selective printouts of the messages left.

There has thus been outlined, rather broadly, the more important features of the invention in order that the detailed description thereof that follows may be better understood, and in order that the present contribution to the art may be better appreciated. There are additional features of the invention that will be described hereinafter and which will form the subject matter of the claims appended hereto.

The objects of the invention, along with the various features of novelty which characterize the invention, are pointed out with particularity in the claims annexed to and forming a part of this disclosure.

## **BRIEF DESCRIPTION OF THE DRAWINGS**

The invention will be better understood and objects other than those set forth above will become apparent when consideration is given to the following detailed description thereof. Such description makes reference to the annexed drawings wherein:

Figure 1 is a perspective view of a new telephone message exporting system according to the present invention.

5        Figure 2 is a front view of the present invention.

Figure 3 is a schematic view of the present invention.

## **DESCRIPTION OF THE PREFERRED EMBODIMENT**

10        With reference now to the drawings, and in particular to Figures 1 through 3 thereof, a new telephone message exporting system embodying the principles and concepts of the present invention and generally designated by the reference numeral 10 will  
15        be described.

As best illustrated in Figures 1 through 3, the telephone message exporting system 10 generally comprises a telephone answering machine 20 having a main housing 22. A central  
20        processor 24 is positioned in the main housing 22. An outgoing message storage assembly 26 is positioned in the main housing 22 for storing an outgoing message to be played when the answering machine 20 responds to an incoming call. The outgoing message storage assembly 26 is operationally coupled to the central  
25        processor 24. An incoming message storage assembly 28 is positioned in the main housing 22 and operationally coupled to the central processor 24 for storing an incoming message from a caller as a stored audio message. A written translation program 30 is operationally coupled to the central processor 22 and the incoming  
30        message storage assembly 28 for translating the stored audio message into a written message. A printer 32 is positioned in the

main housing 22 and operationally coupled to the central processor 24 for printing out the written message.

A user input means 34 is operationally coupled to the central processor 24 for controlling operational functions of the central processor 24. In an embodiment, the user input means comprises a plurality of operational keys 36 or buttons. Alternately, dials or word recognition software may be used to permit a user to input information to the central processor to perform the various functions of the invention as desired by the user. These functions include the ability to program the central processor 22 to cause automatic deletion of the stored audio message from the incoming message storage assembly upon printing of the written message translated from the stored audio message.

In an embodiment, a memo storage assembly 40 is operationally coupled to the central processor 22 for storing audio memoranda as a stored audio memo. In this embodiment, the written translation program 30 is operationally coupled to the central processor 22 and the memo storage assembly 40 for translating the stored audio memo into a written memo. The stored incoming messages may also be translated to writing in this embodiment as desired by the user.

Preferably, the collected messages and memos can be reviewed aurally and then selectively deleted or saved in the same fashion as currently existing answering machine systems. Printing of messages can be achieved for saved messages or current messages collected.

In an embodiment, an electronic form translation program 44 is operationally coupled to the central processor 22 and the incoming message storage assembly 28 for translating the stored audio message into an electronic data file for exporting to an electronic device. A data transfer port 46 is operationally coupled to the central processor 22 for facilitating exporting the electronic data file. The data transfer port 46 may be an infra-red data transfer port or a networking port for hard-wiring a connection to the invention.

Preferably, a paper supply 48 is coupled directly to or positioned substantially within the main housing 22 to provide paper to the printer of the invention. The paper supply 48 may employ a roll of paper or an input tray supplied with sheets of paper.

The telephone answering machine may further incorporate a telephone headset, cordless handset, speed dialing, speakerphone, multiple line features, dialing from memory, telephone charging capability, and other such features currently known and incorporated into telephones.

Except where they are mutually exclusive, the features described above may be combined in various combinations to form additional embodiments of the invention.

In use, the answering machine is connected to a telephone line to receive incoming messages. The messages are stored digitally in a form that is selectively output to the user in aural or written form depending on the preference of the user.

With respect to the above description then, it is to be realized that the optimum dimensional relationships for the parts of the invention, to include variations in size, materials, shape, form, function and manner of operation, assembly and use, are deemed readily apparent and obvious to one skilled in the art, and all equivalent relationships to those illustrated in the drawings and described in the specification are intended to be encompassed by the present invention.

Therefore, the foregoing is considered as illustrative only of the principles of the invention. Further, since numerous modifications and changes will readily occur to those skilled in the art, it is not desired to limit the invention to the exact construction and operation shown and described, and accordingly, all suitable modifications and equivalents may be resorted to, falling within the scope of the invention.
